

### ABSTRACT

An image recording material magazine is provided that has a constitution such that a roll-form image recording material rotatably provided within a casing is drawn out through a slot provided along its whole length in the longitudinal direction with a resilient plate having a force pressing it so as to close the slot and with a cloth member abutting against the plate, the plate being fixed to a support part, which is provided within the magazine in the vicinity of the slot, at an angle that allows a force pressing the material in its thickness direction to be generated when the material is drawn out. The plate is formed from a polyolefin based resin plastic sheet having a water absorption of 0.01 wt% or less, has its surface embossed, and has its tip portion formed with a curved surface so that the embossed surface abuts against the image recording material.
